When I started this project, I thought of using Tableau to do the visualization work. But then I thought that would be too easy, so I choose to practice doing it with Highcharts. It was easy to make a simple chart. However, customizing to make it a satisfying chart was a bit of challenge. It took a while for me to understand the codes before I know what I actually need to put in my code.

It also took me a while to find out what data should be graphed. I had totally no idea where to start at first. So, I decided to just try everything out. I added the sales amount up and tried mapping all the possible combinations and see what possible relationship there could be. At last, I managed to pull out a few usefull graphs from the many I made.
